## 303. Range Sum Query - Immutable

## 题目描述: https://leetcode.com/problems/range-sum-query-immutable/

```
给定一组数,求某个坐标范围内的和可能被call多次,注意复杂度。例如:

Given nums = [-2, 0, 3, -5, 2, -1]
sumRange(0, 2) -> 1
sumRange(2, 5) -> -1
```

## 解题思路:

初始化时先计算好截止到当前位置的前n个数的和。这样每次调用的时候只用做一次判断和一次减法。

 $sumRange(0, 5) \rightarrow -3$ 

## 代码:

```
class NumArray {
public:
    vector<int> sum;
    NumArray(vector<int> &nums) {
        int res = 0;
        for(int i = 0; i < nums.size(); i++){</pre>
             res += nums[i];
             sum.push back(res);
            cout << res << " ";
        }
        cout << endl;
    }
    int sumRange(int i, int j) {
        int a;
        if(i \le 0)
             a = 0;
        else
             a = sum[i-1];
        return sum[j]-a;
    }
};
```
